

| Question    | Answer  | Marks            |
|-------------|---|------------------|
| 1 (a)       | Power is equal to the rate of work done.  | 1                |
| 1 (b) (i)   | The tension in the cable is equal to the weight because the net force is zero.<br>tension = $mg = 1500 \times 9.81$<br>tension = $1.47 \times 10^4 \text{ N}$   | 1<br>1<br>1      |
| 1 (b) (ii)  | power = $Fv = mg \times v$<br>power = $1500 \times 9.81 \times 1.2$<br>power = $1.77 \times 10^4 \text{ W}$   | 1<br>1<br>1      |
| 2 (a)       | kinetic energy = $\frac{1}{2} \times \text{mass} \times \text{speed}^2$   | 1                |
| 2 (b) (i)   | initial KE = $\frac{1}{2} \times 3.0 \times 10^{-2} \times 200^2 (= 600 \text{ J})$<br>final KE = $\frac{1}{2} \times 3.0 \times 10^{-2} \times 50^2 (= 37.5 \text{ J})$<br>Loss in KE = $600 - 37.5$<br>Loss in KE = $562.5 \text{ J}$   | 1<br>1<br>1      |
| 2 (b) (ii)  | work done = (loss in) KE<br>$a = \frac{(v^2 - u^2)}{2s}$<br>$F \times 1.5 \times 10^{-2} = 562.5$<br>$a = (-)1.25 \times 10^6$<br>force = $3.75 \times 10^4 \text{ N}$  | 1<br>1           |
| 2 (c)       | Measure the mass $m$ of the student using scales.<br>Measure the distance $x$ between two fixed markers using a tape measure (or metre rule) and the time $t$ taken for the student to travel between these two markers using a stopwatch.<br>Determine the speed $v$ using $v = \frac{x}{t}$ .<br>The kinetic energy is determined using $E_k = \frac{1}{2} m v^2$ | 1<br>1<br>1<br>1 |
| 3 (a)       | <u>total</u> energy of a (closed) system remains constant<br>or<br>Energy cannot be created or destroyed (it can only be transferred into other forms)<br>or<br><u>total initial energy = total final energy</u>  | 1                |
| 3 (b)       | work done = force $\times$ distance <u>moved</u><br>in the direction of the force<br>Unit: N m or J   | 1                |
| 3 (c) (i)   | <u>kinetic energy</u> $\rightarrow$ heat  | 1                |
| 3 (c) (ii)  | $(E = \frac{1}{2} m v^2)$<br>$8.4 \times 10^{16} = \frac{1}{2} \times 3.0 \times 10^8 \times v^2$<br>$v^2 = \frac{2 \times 8.4 \times 10^{16}}{3.0 \times 10^8}$ or $v = \sqrt{\frac{2 \times 8.4 \times 10^{16}}{3.0 \times 10^8}}$<br>$v = 2.37 \times 10^4 \text{ m s}^{-1}$   | 1<br>1           |
| 3 (c) (iii) | $8.4 \times 10^{16} = F \times 200$<br>$F = \frac{8.4 \times 10^{16}}{200}$<br>force = $4.2 \times 10^{14} \text{ N}$   | 1<br>1<br>1      |
| 4 (a)       | base unit for force = base unit for mass (kg) $\times$ base unit for acceleration ( $\text{m s}^{-2}$ )<br>base unit for force = $\text{kg m s}^{-2}$<br>base unit for work done = base unit for force ( $\text{kg m s}^{-2}$ ) $\times$ base unit for distance (m)<br>base unit for work done = $\text{kg m}^2 \text{ s}^{-2}$                                     | 1<br>1<br>1      |

| Question    | Answer  | Marks            |
|-------------|---|------------------|
| 4 (b) (i)   | speed $v = \frac{12}{8.0}$<br>$E_k = \frac{1}{2} m v^2 = \frac{1}{2} \times 70 \times \left(\frac{12}{8.0}\right)^2$<br>$E_k = 79 \text{ J}$  | 1<br>1<br>1      |
| 4 (b) (ii)  | $h = 12 \sin 32^\circ$<br>$E_p = m g h = 70 \times 9.81 \times (12 \sin 32^\circ)$<br>$E_p = 4.37 \times 10^3 \text{ J}$  | 1<br>1<br>1      |
| 4 (b) (iii) | $P = \frac{4.37 \times 10^3}{8.0}$<br>$P = 546 \text{ W}$   | 1<br>1           |
| 5 (a)       | The initial energy of the skydiver is gravitational potential energy.<br>As he descends, there is loss of gravitational potential energy and gain in kinetic energy.<br>At steady (terminal) velocity, the kinetic energy remains the same.<br>The loss of gravitational potential energy is equal to energy transferred to the air as kinetic energy or as heat. | 1<br>1<br>1<br>1 |
| 5 (b)       | rate of work done = $F v = m g \times v$<br>rate of work done = $80 \times 9.81 \times 45$<br>rate of work done = $3.53 \times 10^4 \text{ W}$  | 1<br>1<br>1      |
| 6 (a)       | Energy is defined as the capacity to do work.<br>Power is the rate of work done (or rate of energy transfer).   | 1<br>1           |
| 6 (b)       | A power of 1 watt is equal to 1 joule of work done per second.  | 1                |
| 6 (c) (i)   | gain in GPE = $m g h = (70 \times 8) \times 9.81 \times 120$<br>gain in GPE = $6.59 \times 10^5 \text{ J}$  | 1<br>1           |
| 6 (c) (ii)  | minimum power $P = \frac{\text{total work done}}{\text{time}}$<br>$P = \frac{[(70 \times 8) + 1500] \times 9.81 \times 120}{55}$<br>$P = 4.4 \times 10^4 \text{ W}$   | 1<br>1<br>1      |
| 7 (a) (i)   | average speed = $\frac{5000}{900} (= 5.56 \text{ m s}^{-1})$<br>kinetic energy = $\frac{1}{2} m v^2 = \frac{1}{2} \times 70 \times \left(\frac{5000}{900}\right)^2$<br>kinetic energy = 1080 J  | 1<br>1<br>1      |
| 7 (a) (ii)  | loss in GPE = $m g h = 70 \times 9.81 \times 520$<br>loss in GPE = $3.57 \times 10^5 \text{ J}$   | 1<br>1           |
| 7 (a) (iii) | Energy is dissipated as work is done against resistive forces; hence the loss in GPE is not equal to the average KE of the runner.  | 1                |
| 7 (b) (i)   | The total energy of a closed system remains constant – energy can neither be created nor destroyed.   | 1                |
| 7 (b) (ii)  | gain in KE = loss in GPE<br>$\frac{1}{2} m v^2 = m g h$ or $v = \sqrt{2 g h}$<br>$v = \sqrt{2 \times 9.81 \times 520} \text{ m s}^{-1}$ (more than $100 \text{ m s}^{-1}$ , if there are no losses)   | 1<br>1<br>1      |
| 8 (a)       | loss in GPE = $m g h = 72 \times 9.81 \times 60$<br>loss in GPE = $4.238 \times 10^4 \text{ J}$   | 1<br>1           |
| 8 (b)       | KE = $\frac{1}{2} m v^2 = \frac{1}{2} \times 72 \times 20^2 = 1.44 \times 10^4 \text{ J}$<br>work done against resistive forces = $(4.238 - 1.440) \times 10^4$<br>work done against resistive forces = $2.798 \times 10^4 \text{ J}$   | 1<br>1<br>1      |
| 8 (c)       | distance travelled = $\frac{60}{\sin(35)} = 104.6 \text{ m}$<br>$2.798 \times 10^4 = F \times 104.6$ (work done = $F x$ )<br>$F = 270 \text{ N}$  | 1<br>1<br>1      |
