

Friday 27 January 2012 – Afternoon

A2 GCE PHYSICS B (ADVANCING PHYSICS)

G495 Field and Particle Pictures

Candidates answer on the Question Paper.

OCR supplied materials:

- Data, Formulae and Relationships Booklet (sent with general stationery)
- Insert (inserted)

Other materials required:

- Electronic calculator
- Ruler (cm/mm)

Duration: 2 hours

Candidate forename		Candidate surname	
--------------------	--	-------------------	--

Centre number						Candidate number				
---------------	--	--	--	--	--	------------------	--	--	--	--

INSTRUCTIONS TO CANDIDATES

- The Insert will be found in the centre of this document.
- Write your name, centre number and candidate number in the boxes above. Please write clearly and in capital letters.
- Use black ink. HB pencil may be used for graphs and diagrams only.
- Answer **all** the questions.
- Read each question carefully. Make sure you know what you have to do before starting your answer.
- Write your answer to each question in the space provided. Additional paper may be used if necessary but you must clearly show your candidate number, centre number and question number(s).
- Do **not** write in the bar codes.

INFORMATION FOR CANDIDATES

- The number of marks is given in brackets [] at the end of each question or part question.
- The total number of marks for this paper is **100**.
- You may use an electronic calculator.
-  Where you see this icon you will be awarded marks for the quality of written communication in your answer.
This means for example, you should:
 - ensure that text is legible and that spelling, punctuation and grammar are accurate so that the meaning is clear
 - organise information clearly and coherently, using specialist vocabulary when appropriate.
- You are advised to show all the steps in any calculations.
- This document consists of **24** pages. Any blank pages are indicated.
- The questions in Section C are based on the material in the Insert.

Answer **all** the questions.

Section A

1 Here is a list of five units:

$$\text{Wb m}^{-2}$$

$$\text{C s}^{-1}$$

$$\text{J C}^{-1}$$

$$\text{J s}^{-1}$$

$$\text{Wb s}^{-1}$$

(a) Which unit is equivalent to the tesla (T)?

unit [1]

(b) Which two units are equivalent to the volt (V)?

unit and [2]

2 Use the equations $p = mv = \frac{h}{\lambda}$ and $E_k = \frac{1}{2}mv^2$ to show that

(a)
$$E_k = \frac{p^2}{2m}$$

(b)
$$\lambda = \frac{h}{\sqrt{2mE_k}}.$$

[2]

(c) Calculate the wavelength of an electron with a kinetic energy $E_k = 2.0 \times 10^{-18} \text{ J}$.

$$h = 6.6 \times 10^{-34} \text{ J s}$$

$$m = 9.1 \times 10^{-31} \text{ kg}$$

wavelength = m [1]

3 Two coils are wrapped around a laminated iron core as shown in Fig. 3.1.

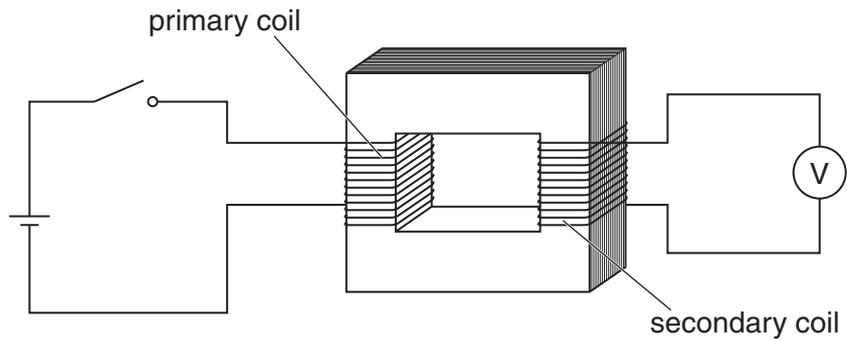

Fig. 3.1

The switch is closed at time t_1 . The current in the primary coil rises as shown in the graph in Fig. 3.2.

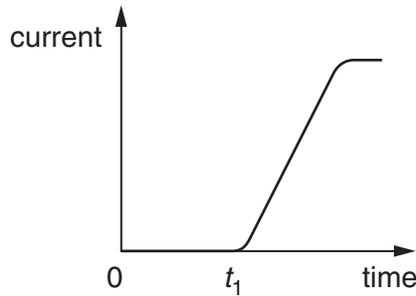

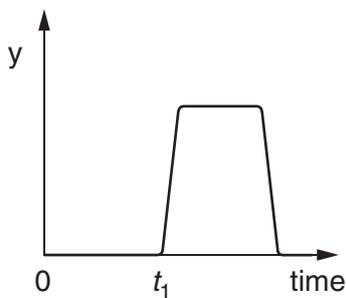

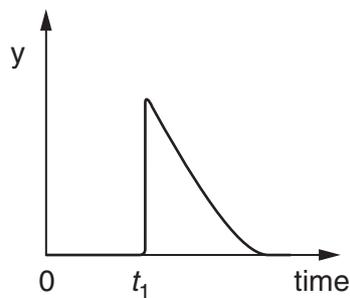

Fig. 3.2

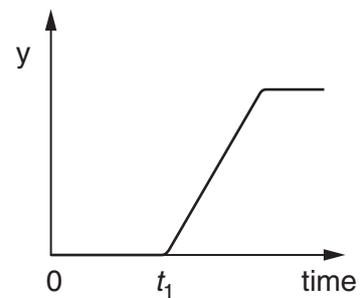

Here are three graphs showing variation of y-value against time. Time t_1 is shown on the graphs.

A

B

C

(a) Which graph shows the relationship between flux in the secondary coil (y-value) and time?

graph [1]

(b) Which graph shows the relationship between the magnitude of the emf across the secondary coil (y-value) and time?

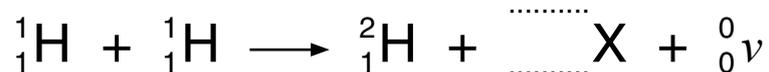

graph [1]

- 4 A spark plug ionises the air between two plates separated by 0.4 mm. A p.d. of 3 kV is required for the air to ionise. Calculate the magnitude of the electric field strength between the plates.

Assume the field is uniform.

electric field strength = V m^{-1} [1]

- 5 The fusion of hydrogen into helium is the source of the Sun's energy. The first stage of the process is shown below.

Complete the equation and identify particle X.

particle X is [2]

- 6 Fig. 6.1 shows a beam of electrons entering the space between two metal plates in a vacuum. The upper plate is at a positive potential and the lower plate is earthed.

On leaving the plates the beam strikes a screen.
Complete the path of the beam to the screen.

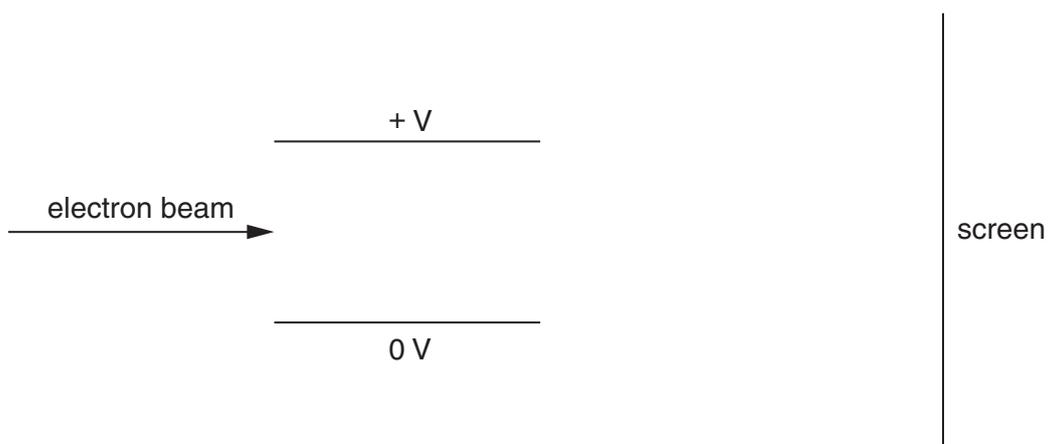

Fig. 6.1

[2]

- 7 An iron core is shaped as shown in Fig. 7.1. Current in the coil produces flux Φ in the iron. The cross-sectional area of the core at **X** is twice the cross-sectional area at **Y**.

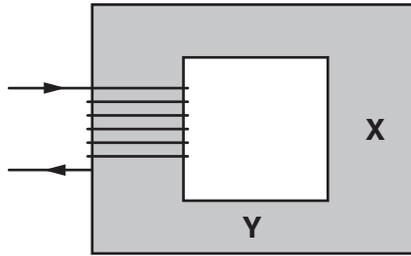

Fig. 7.1

The core behaves ideally and there is no flux leakage.

- (a) State how the flux through **X** compares with the flux through **Y**.

[1]

- (b) State how the flux density through **X** compares with the flux density through **Y**.

[1]

- 8 A school cobalt-60 source has an activity of 125 kBq.
The source will be replaced when the activity falls to 35 kBq.
The decay constant of cobalt-60 = $4.1 \times 10^{-9} \text{ s}^{-1}$.

Show that the school will need to replace the source after about 10 years.

$$1 \text{ year} = 3.2 \times 10^7 \text{ s}$$

[2]

- 9 Experiments show that the radius r of a nucleus is given by the relationship

$$r = r_0 A^{\frac{1}{3}}$$

where A is the nucleon (mass) number of the nucleus
 r_0 is a constant.

- (a) Choose the statement below which gives the relationship between the volume V of the nucleus and A .

- A V is proportional to A^3
- B V is proportional to A^2
- C V is proportional to A
- D V is proportional to $A^{\frac{1}{2}}$

The relationship is given by statement [1]

- (b) The radius of a gold nucleus ${}_{79}^{197}\text{Au}$ is $7.0 \times 10^{-15} \text{ m}$.

Use this value to show that the radius of an alpha particle, ${}_{2}^4\text{He}$ is about $2 \times 10^{-15} \text{ m}$.

[2]

[Section A Total: 20]

BLANK PAGE

PLEASE DO NOT WRITE ON THIS PAGE

Section B

10 This question is about the design of a simple d.c. motor as shown in Fig. 10.1.

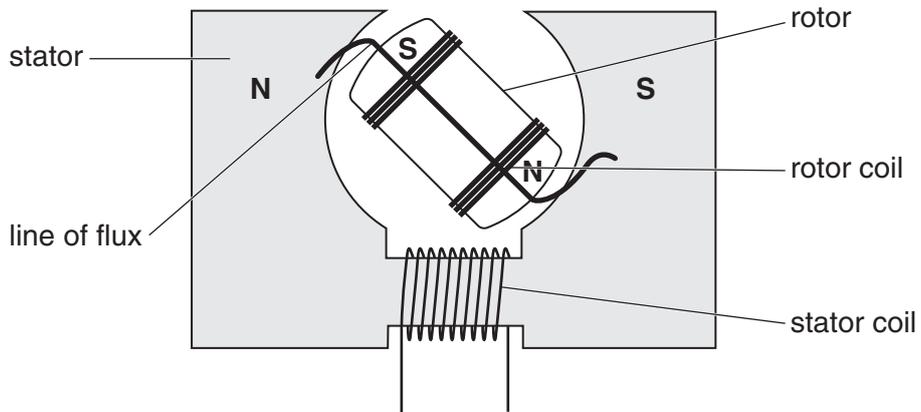

Fig. 10.1

Current in the stator coil produces a magnetic flux in the stator. There is also a current in the rotor coils. The rotor is turning anticlockwise.

- (a) Part of a flux line is shown. Complete the flux line and explain how the shape of the line suggests that the rotor will experience an anti-clockwise force.

[2]

(b) The rotor is laminated; it is made of layers of iron separated by thin layers of insulator.

(i) Explain how the choice of an **iron** rotor together with **curved** poles on the stator help improve the performance of the motor.

[3]

(ii) Explain why **laminating** the iron rotor increases the flux in the magnetic circuit.

[2]

(c) When the motor is first switched on there is a large current in the rotor coil, but as the rotor speeds up the current decreases. Use ideas about electromagnetic induction to explain why the current decreases.

[3]

[Total: 10]

11 This question is about the electric field near a positively-charged sphere.

Fig. 11.1

Fig. 11.1 shows an isolated, positively-charged metal sphere.

(a) On Fig. 11.1 draw four field lines from the surface of the sphere. [2]

(b) The radius of the sphere is 4.0 mm and the charge on it is $+2.5 \times 10^{-9}$ C. Show that the potential at the surface of the sphere is about +5.6 kV.

$$k = \frac{1}{4\pi\epsilon_0} = 9 \times 10^9 \text{ Nm}^2\text{C}^{-2}$$

[2]

(c) The graph in Fig. 11.2 gives the potential at increasing distance from the sphere.

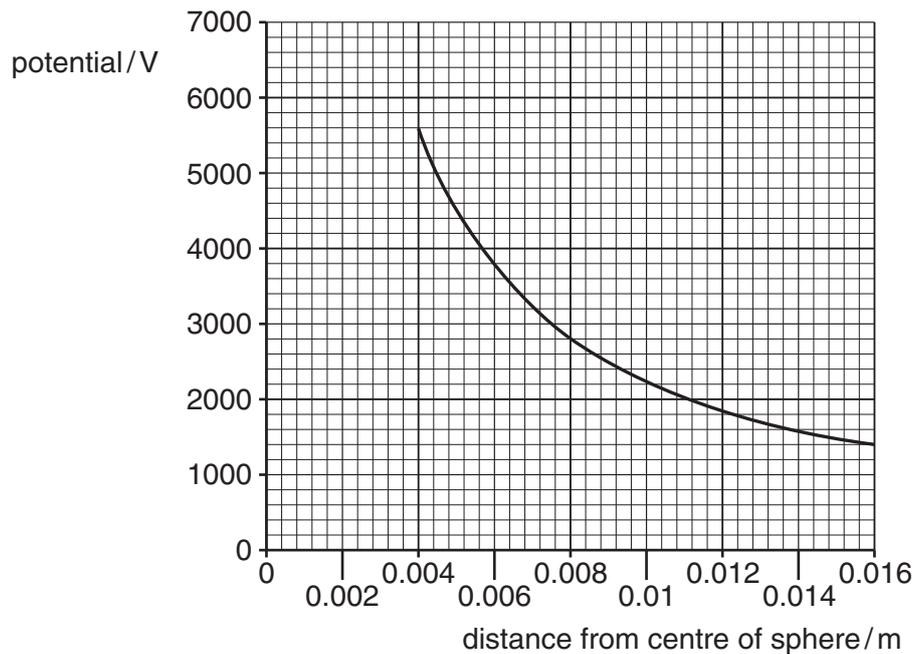

Fig. 11.2

- (i) Explain how the graph could be used to show that the potential is inversely proportional to the distance from the centre of the sphere.

[2]

- (ii) Use data from the graph to calculate the magnitude of the electric field strength at a distance of 0.0080m from the centre of the sphere. Explain your method clearly.

field strength = NC^{-1} [2]

- (d) The sphere is brought near an identically charged metal sphere as shown in Fig. 11.3.

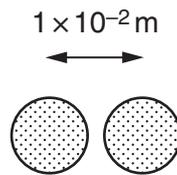

Fig. 11.3

Using the equation $F = \frac{kq_1q_2}{r^2}$ gives a value for the force between the spheres of $5.6 \times 10^{-4} \text{ N}$.

Explain why the actual force between the metal spheres at this separation is less than $5.6 \times 10^{-4} \text{ N}$.

[2]

[Total: 10]

- 12** This question is about the unstable isotope potassium-40.
Potassium-40 undergoes beta decay. This decay is represented in the equation:

- (a) Name the particle represented by $\bar{\nu}$ [1]
- (b) (i) Calculate the total energy released in the beta decay of a potassium-40 nucleus.

$$\text{mass of } {}_{19}^{40}\text{K} = 39.953579 \text{ u}$$

$$\text{mass of } {}_{20}^{40}\text{Ca} = 39.951610 \text{ u}$$

$$\text{electron mass} = 0.000549 \text{ u}$$

$$\text{electronic charge} = 1.60 \times 10^{-19} \text{ C}$$

$$\text{atomic mass unit, u} = 1.66 \times 10^{-27} \text{ kg}$$

$$\text{speed of light, c} = 3.00 \times 10^8 \text{ m s}^{-1}$$

In your working include the values indicated below.

$$\text{change in mass} = \dots\dots\dots \text{ u} = \dots\dots\dots \text{ kg}$$

$$\text{total energy released} = \dots\dots\dots \text{ J} = \dots\dots\dots \text{ MeV}$$

[4]

- (ii) The kinetic energy of the beta particle is generally less than the total energy released.
State where the remaining energy goes.

[1]

- (c) The decay of potassium in the human body contributes the largest proportion of radiation produced inside the body.

The amount of potassium-40 in an adult body is about 1.5×10^{-5} kg. This represents about 2.2×10^{20} atoms.

- (i) The half-life of potassium-40 is 4.2×10^{16} seconds. Show that the activity of the potassium-40 in the adult body is about 4000 Bq.

[2]

- (ii) The great majority of the decays release beta particles as above. The mean energy of these particles is about 7×10^{-14} J.

Estimate the dose from beta emission for a 60 kg person in one year.
State any assumptions you make.

$$1 \text{ year} = 3.2 \times 10^7 \text{ s}$$

dose = Gy [3]

- (iii) The lifetime risk of developing a cancer is about 3% per sievert. Estimate the number of cancers developed due to potassium decay in a population of 40 million people over a period of 50 years.

quality factor of beta radiation = 1

number of cancers in population of 40 million = [2]

[Total: 13]

- 13 This question is about a cyclotron, an early form of particle accelerator. It consists of two hollow semi-circular metal 'dees' in a uniform magnetic field of 0.80 T in a vacuum. The dees are separated by a gap as shown in Fig. 13.1.

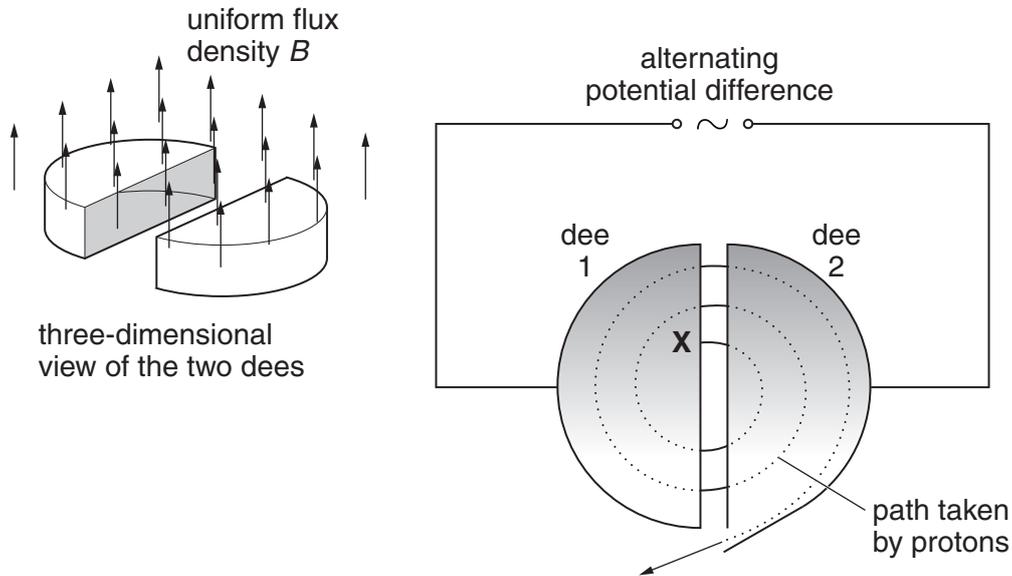

Fig. 13.1

Protons are injected into the gap between the dees at X and are accelerated by the potential difference between the dees. The magnetic field is directed out of the paper in Fig. 13.1 and the protons move in a circular path through the dees. There is no electric field inside the dees.

- (a) (i) State why it is necessary to have a vacuum inside the cyclotron.

[1]

- (ii) Explain why the protons move in a circular path with constant speed inside a dee.

[2]

- (b) The protons are accelerated through a p.d. of 400V each time they cross the gap between the dees.

Show that a proton will have gained an energy of 9.6×10^{-15} J after crossing the gap between the dees 150 times.

$$\text{electronic charge} = 1.6 \times 10^{-19} \text{ C}$$

[1]

- (c) The radius r of the path of a particle of mass m and kinetic energy E_k in a dee is given by the equation

$$r = \frac{\sqrt{2mE_k}}{Bq}$$

where B is the magnetic field strength and q is the charge on the particle.

Calculate the radius of the path of a proton of kinetic energy 9.6×10^{-15} J in a magnetic field of strength 0.80 T.

mass of proton = 1.7×10^{-27} kg
 electronic charge = 1.60×10^{-19} C

radius =m [2]

- (d) Cyclotrons are not used to accelerate electrons because electrons show relativistic behaviour at the energies reached.

Use the relativistic factor γ to explain why an electron of kinetic energy 9.6×10^{-15} J shows relativistic behaviour to a greater extent than a proton of the same kinetic energy.

rest energy of electron = 0.511 MeV
 rest energy of proton = 938 MeV

[3]

[Total: 9]

[Section B Total: 42]

Section C

The questions in this section are based on the Advance Notice.

14 Ceiling balloons are used to determine the altitudes of cloud bases (lines 2 and 3 in the article). When released, they ascend and quickly reach a vertical speed of 150 metres per minute.

(a) Show that the height of a cloud into which a ceiling balloon disappears 400s after being released is about 1000m.

[1]

(b) Suggest and explain one reason for this method of determining cloud height gives only approximate results.

[2]

(c) The volume of gas used to fill the balloon at launch is 0.030m^3 . As the altitude increases, both the temperature and the pressure of the gas change, as given in the table, Fig. 14.1.

altitude/m	temperature/K	pressure/kPa	volume/ m^3
0	293	101.3	0.030
1000	280	89.1	

Fig. 14.1

Complete the table by calculating the volume that the same mass of gas would occupy at an altitude of 1000m. Assume ideal gas behaviour.

[2]

[Total: 5]

15 Weather balloons carry scientific instruments high into the atmosphere to make a range of meteorological measurements (lines 6 and 7 in the article).

(a) State two physical properties it would be important for the material of the weather balloon to possess. Give a reason why each property is important.

(i) property:

reason:

(ii) property:

reason:

[4]

(b) The diameter of the balloon when launched is 2.0m and at this size the balloon fabric is **unstrained**. The diameter increases to 8.0m when the balloon reaches an altitude of 35 km.

By considering the circumference of the spherical balloon, calculate the strain in the balloon fabric at an altitude of 35 km.

strain = [2]

- (c) Box 1 in the article shows that the buoyancy force, B , on the balloon, when launched, is given by

$$B = \text{weight of air displaced.}$$

Show that at launch, B is approximately 50 N.

$$\begin{aligned} \text{radius of balloon} &= 1.0 \text{ m} \\ \text{density of air at launch} &= 1.2 \text{ kg m}^{-3} \\ g &= 9.8 \text{ N kg}^{-1} \end{aligned}$$

[3]

- (d) Hence show that the initial upwards acceleration of the balloon is about 30 m s^{-2} .

$$\text{total mass of inflated balloon + load} = 1.25 \text{ kg}$$

[2]

- (e) Suggest why the acceleration changes as the balloon rises.

Your explanation should be carefully ordered and clear.

[3]

[Total: 14]

- 16 In 2009, some impressive photographs of the Earth were taken by relatively cheap cameras from high-altitude weather balloons. In one such image (Fig. 16.1, Fig. 3 in the article), the width of the photograph spans a distance on the ground of 1100 m.

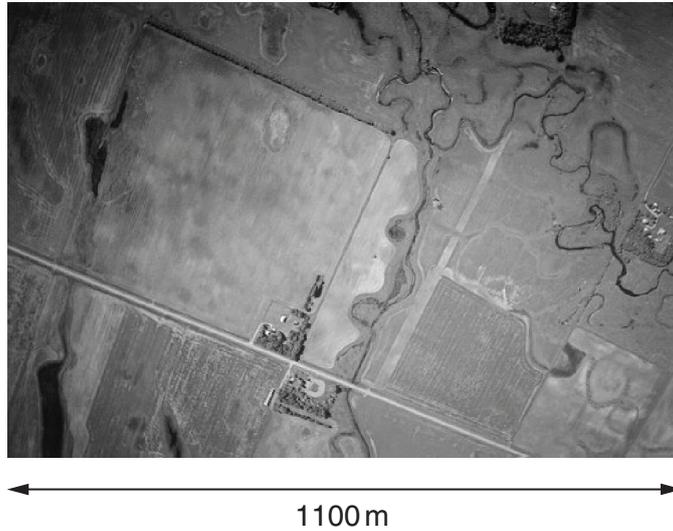

Fig. 16.1

The camera screen was made up of an array of 4352×3264 pixels.

- (a) Calculate the resolution of the image.

resolution = m pixel⁻¹ [1]

- (b) (i) In the original image, each pixel has three colour segments. Each segment has 256 intensity levels. Calculate the number of bits required to store one image.

number of bits = [2]

- (ii) Calculate the number of images that could be stored on an 8 Gbyte memory card.

number of images = [2]

[Total: 5]

- 17 Interactions between high energy cosmic rays (mostly protons) and atoms and molecules in the upper atmosphere can create other particles such as mesons, which travel at very high speed down to the Earth's surface (lines 64–66 in the article).

- (a) Ignoring relativistic effects, calculate the speed of a 10 MeV proton.

$$1 \text{ eV} = 1.6 \times 10^{-19} \text{ J}$$

$$\text{mass of proton} = 1.7 \times 10^{-27} \text{ kg}$$

speed = ms^{-1} [2]

- (b) (i) A meson takes 0.13 ms to travel 35 km to the Earth's surface.

Show that the speed with which it travels to the Earth's surface is about 90% of the speed of light, c .

$$\text{speed of light, } c = 3.0 \times 10^8 \text{ ms}^{-1}$$

[2]

- (ii) The half-life of these mesons travelling at 90% of the speed of light is 0.13ms. Calculate the half-life of these mesons at rest.

half-life = s [3]

[Total: 7]

- 18 The BOOMERANG study resulted in a picture showing temperature fluctuations in the early universe (Fig. 5 in the article, reproduced as Fig. 18.1 below).

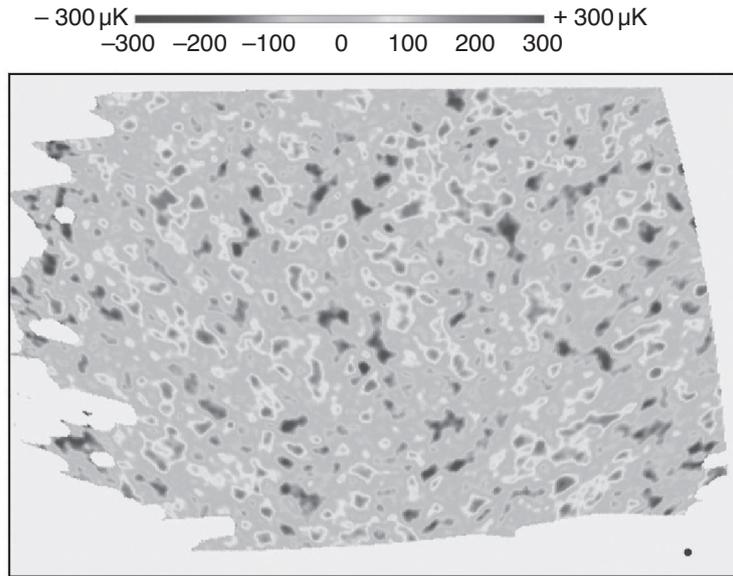

Fig. 18.1

- (a) Estimate the wavelength of the cosmic background radiation photons corresponding to a temperature of 2.7 K.

Boltzmann constant, $k = 1.4 \times 10^{-23} \text{ JK}^{-1}$
 speed of light, $c = 3 \times 10^8 \text{ m s}^{-1}$
 $h = 6.6 \times 10^{-34} \text{ Js}$

wavelength = m [2]

QUESTION 18 CONTINUES OVER THE PAGE

- (b) The temperature variation scale in Fig. 18.1 runs from $300\ \mu\text{K}$ below the mean temperature to $300\ \mu\text{K}$ above it. Assuming a mean temperature of $2.7\ \text{K}$, show that this range is only about 0.02% of $2.7\ \text{K}$.

[2]

- (c) Explain the significance of the observed fluctuations in the temperature when considering the evolution of the universe.

Your explanation should be carefully ordered and clear.
